3 SummaryVars(): Summarize demographics variables (check demographics imbalance)

3.1 Default

```
kable(
SummaryVars(data=sample.data,trt='Arm', subgroup='BEP', var=c('Age','Sex'),
      var.class=c("numeric","categorical"))
)
```

	All(CTRL)	BEP(CTRL)	All(TRT)	BEP(TRT)
Age				
N	182	81	368	176
Mean	52.54	53.1	54.03	54.42
Median	51.5	52	54	54
Min-Max	27…85	32…85	30…89	33…89
NA's	0	0	0	0
Sex				
Total	182	81	368	176
NA's	0	0	0	0
F	89 (48.9%)	39 (48.15%)	184 (50%)	90 (51.14%)
M	93 (51.1%)	42 (51.85%)	184 (50%)	86 (48.86%)

3.2 Compare to non-BEP instead of ITT

```
kable(
SummaryVars(data=sample.data,trt='Arm', subgroup='BEP', var=c('Age','Sex'),
      var.class=c("numeric","categorical"), compare.subgroup=TRUE)
)
```

	BEP_1(CTRL)	BEP_0(CTRL)	BEP_1(TRT)	BEP_0(TRT)
Age				
N	81	101	176	192
Mean	53.1	52.09	54.42	53.67
Median	52	50	54	54
Min-Max	32…85	27…82	33…89	30…79
NA's	0	0	0	0
Sex				
Total	81	101	176	192
NA's	0	0	0	0
F	39 (48.15%)	50 (49.5%)	90 (51.14%)	94 (48.96%)
M	42 (51.85%)	51 (50.5%)	86 (48.86%)	98 (51.04%)

3.3 Allow testing

```
kable(
SummaryVars(data=sample.data,trt='Arm', subgroup='BEP', var=c('Age','Sex'),
      var.class=c("numeric","categorical"), test.subgroup=TRUE)
)
```

	All(CTRL)	BEP(CTRL)	pvalue(CTRL)	All(TRT)	BEP(TRT)	pvalue(TRT)
Age						
N	182	81	0.5	368	176	0.69
Mean	52.54	53.1		54.03	54.42	
Median	51.5	52		54	54	
Min-Max	27…85	32…85		30…89	33…89	
NA's	0	0		0	0	
Sex						
Total	182	81	0.88	368	176	0.75
NA's	0	0		0	0	
F	89 (48.9%)	39 (48.15%)		184 (50%)	90 (51.14%)	
M	93 (51.1%)	42 (51.85%)		184 (50%)	86 (48.86%)	

3.4 Reorder TRT/CTRL arm in display

```
kable(
SummaryVars(data=sample.data,trt='Arm', subgroup='BEP', var=c('Age','Sex'),
      var.class=c("numeric","categorical"), trt.order=c("TRT","CTRL"))
)
```

	All(TRT)	BEP(TRT)	All(CTRL)	BEP(CTRL)

	All(TRT)	BEP(TRT)	All(CTRL)	BEP(CTRL)
Age				
N	368	176	182	81
Mean	54.03	54.42	52.54	53.1
Median	54	54	51.5	52
Min-Max	30...89	33...89	27...85	32...85
NA's	0	0	0	0
Sex				
Total	368	176	182	81
NA's	0	0	0	0
F	184 (50%)	90 (51.14%)	89 (48.9%)	39 (48.15%)
M	184 (50%)	86 (48.86%)	93 (51.1%)	42 (51.85%)

3.5 Combine trt arms

```
kable(
SummaryVars(data=sample.data, subgroup='BEP', var=c('Age','Sex'),
      var.class=c("numeric","categorical"))
)
```

	All	BEP
Age		
N	550	257
Mean	53.53	54
Median	53	54
Min-Max	27...89	32...89
NA's	0	0
Sex		
Total	550	257
NA's	0	0
F	273 (49.64%)	129 (50.19%)
M	277 (50.36%)	128 (49.81%)

4 PlotProperty(): Plot biomarker, clinical covariate property and their association

4.1 Numeric biomarker variable. No clinical variables. Log transformation.

```
PlotProperty(data=input, biomarker.var="KRAS.exprs", biomarker.class="numeric", log2=TRUE)
```

Distribution of KRAS.exprs

N= 461

Mean: 5.97
SD: 1.99
Median: 6.14
Range: (0.51 – 13.22)
4.2 No biomarker variable. Two numeric clinical variables. Log transformation for one varible.

```
PlotProperty(data=input, biomarker.var=NULL, biomarker.class=NULL,
            var=c("Weight","Age"), var.class=c("numeric", "numeric"),
            log2=c(TRUE, FALSE), par.param = list(mfrow=c(1,2), cex.axis=1.2))
```

Distribution of Weight

N= 550

Mean: 6.04
SD: 0.32
Median: 6
Range: (5.13 – 7.3)

Distribution of Age

N= 550

Mean: 53.53
SD: 10.56
Median: 53
Range: (27 – 89)
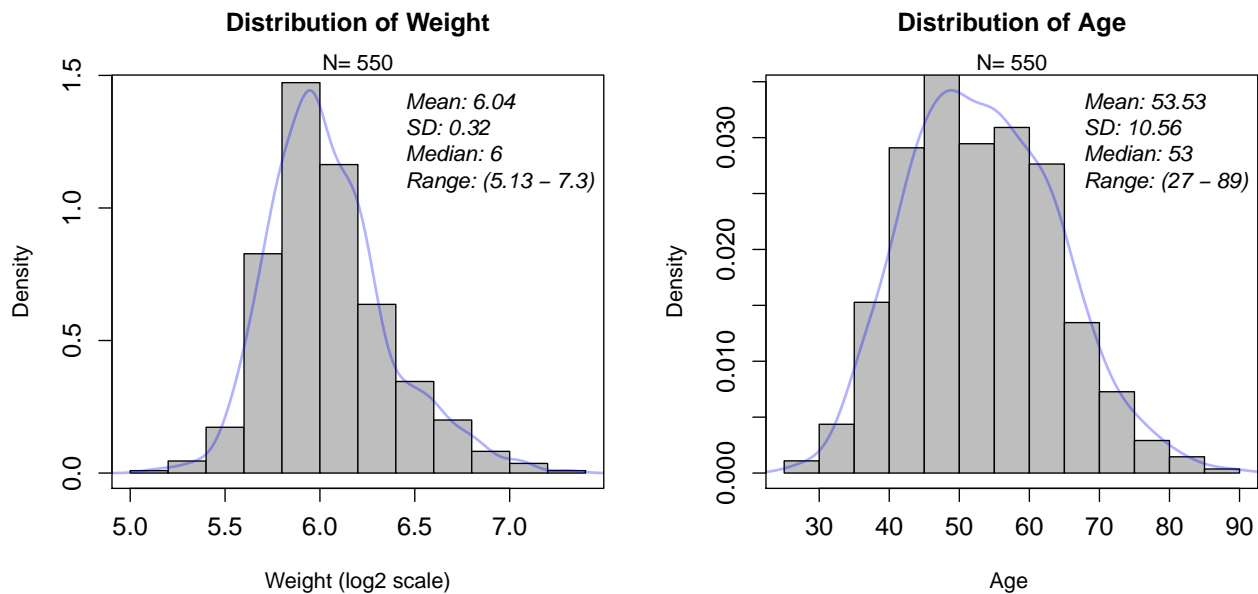

4.3 Numeric biomarker variable. Two clinical categorical variables. Log transformation for numeric variable.

```
PlotProperty(data=input, biomarker.var="KRAS.exprs", biomarker.class="numeric",
             var=c("ECOG", "Country"), var.class=c("categorical", "categorical"),
             log2=TRUE, par.param = list(mfrow=c(3,2), cex.axis=1.2),
             show.clinical.uni=TRUE)
```

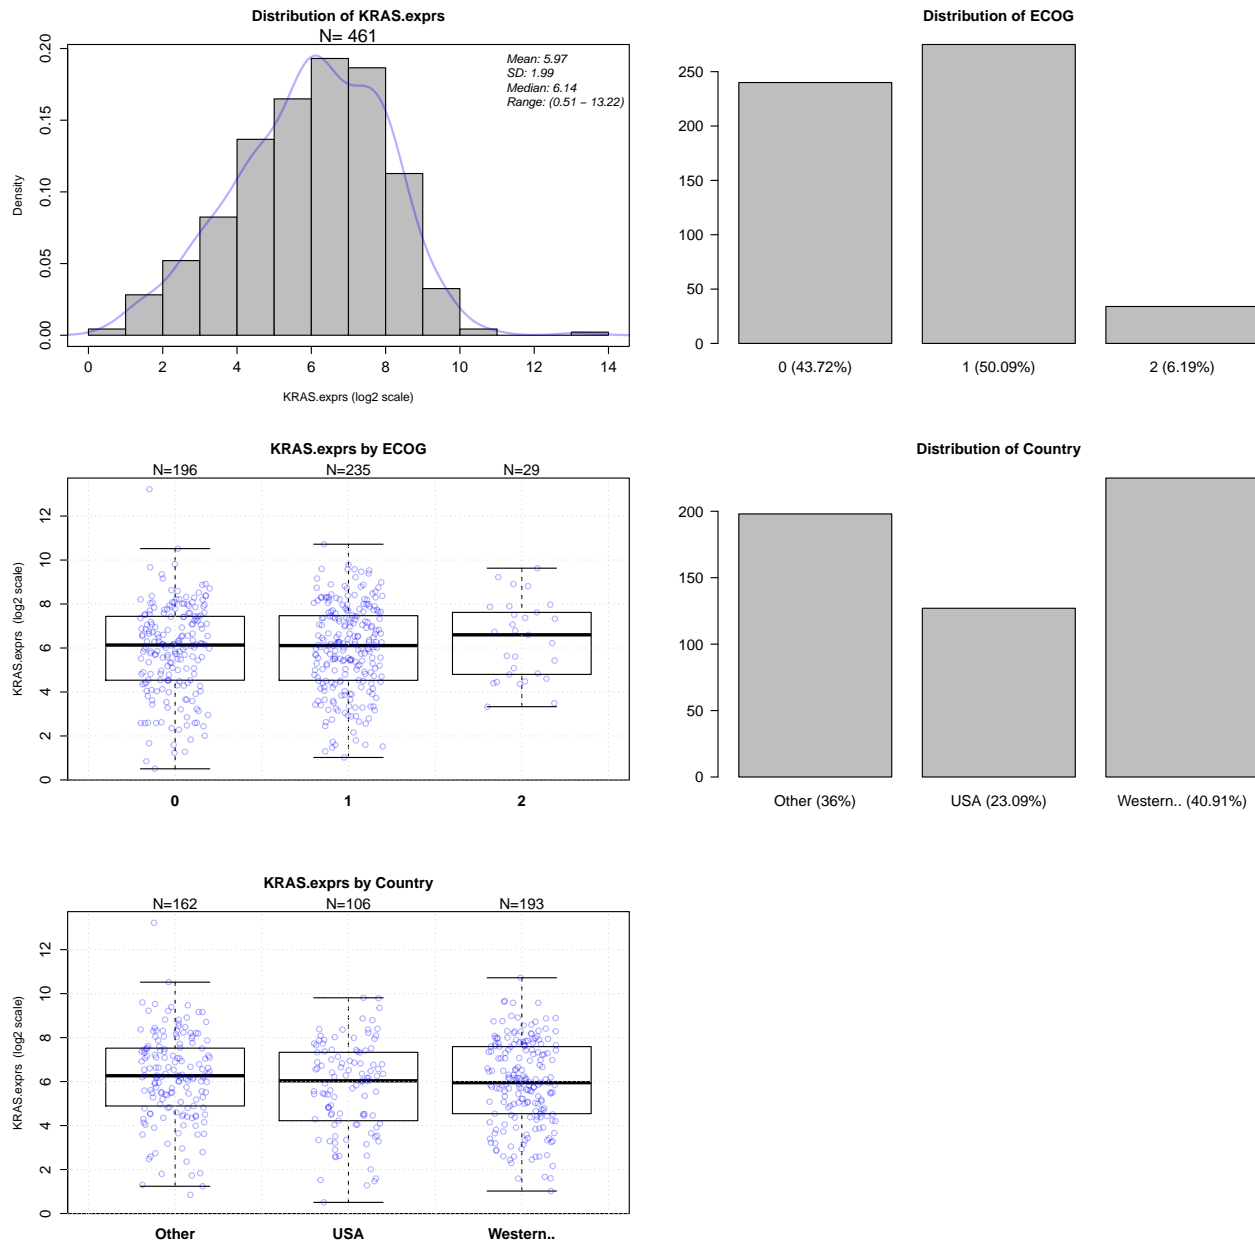

4.4 Numeric biomarker variable. Two clinical variables: one is categorocal, second is numeric. Log transformation for biomarker (numeric) variable.

```
PlotProperty(data=input, biomarker.var="KRAS.exprs", biomarker.class="numeric",
             var=c("Sex", "Age"), var.class=c("categorical", "numeric"),
             log2=c(TRUE, FALSE, FALSE), par.param = list(mfrow=c(3,2), cex.axis=1.4),
             show.clinical.uni=TRUE)
```

Distribution of KRAS.exprs
N= 461

Mean: 5.97
SD: 1.99
Median: 6.14
Range: (0.51 – 13.22)

Distribution of Sex

KRAS.exprs by Sex
N=220   N=241

Distribution of Age
N= 550

Mean: 53.53
SD: 10.56
Median: 53
Range: (27 – 89)

KRAS.exprs by Age
4.5 Categorical biomarker variable. Categorical clinical variable.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
             var="Country", var.class="categorical",
```

```
                par.param = list(mfrow=c(2,2), cex.axis=1.2),
                show.clinical.uni=TRUE)
```

Distribution of KRAS.mutant

Distribution of Country

Distribution of KRAS.mutant by Country

4.6   Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
            var=c("Country", "Age"), var.class=c("categorical", "numeric"),
            par.param = list(mfrow=c(3,2), cex.axis=1.2),
            show.clinical.uni=TRUE)
```

Distribution of KRAS.mutant

Distribution of Country

Distribution of KRAS.mutant by Country

Distribution of Age
N= 550

Mean: 53.53
SD: 10.56
Median: 53
Range: (27 – 89)

Age by KRAS.mutant

4.7 Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Don't plot biomarker variable but plot clinical variables and association between biomarker and clinical variables.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
            var=c("Country", "Age"), var.class=c("categorical", "numeric"),
            par.param = list(mfrow=c(2,2), cex.axis=1.2), show.biomarker.uni = FALSE,
            show.clinical.uni=TRUE)
```

Distribution of Country

Distribution of KRAS.mutant by Country

Distribution of Age

Age by KRAS.mutant

4.8 Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Don't plot clinical variables but plot biomarker variable and association between biomarker and clinical variables.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
            var=c("Country", "Age"), var.class=c("categorical", "numeric"),
            par.param = list(mfrow=c(2,2), cex.axis=1.2))
```

Distribution of KRAS.mutant

Distribution of KRAS.mutant by Country

Age by KRAS.mutant
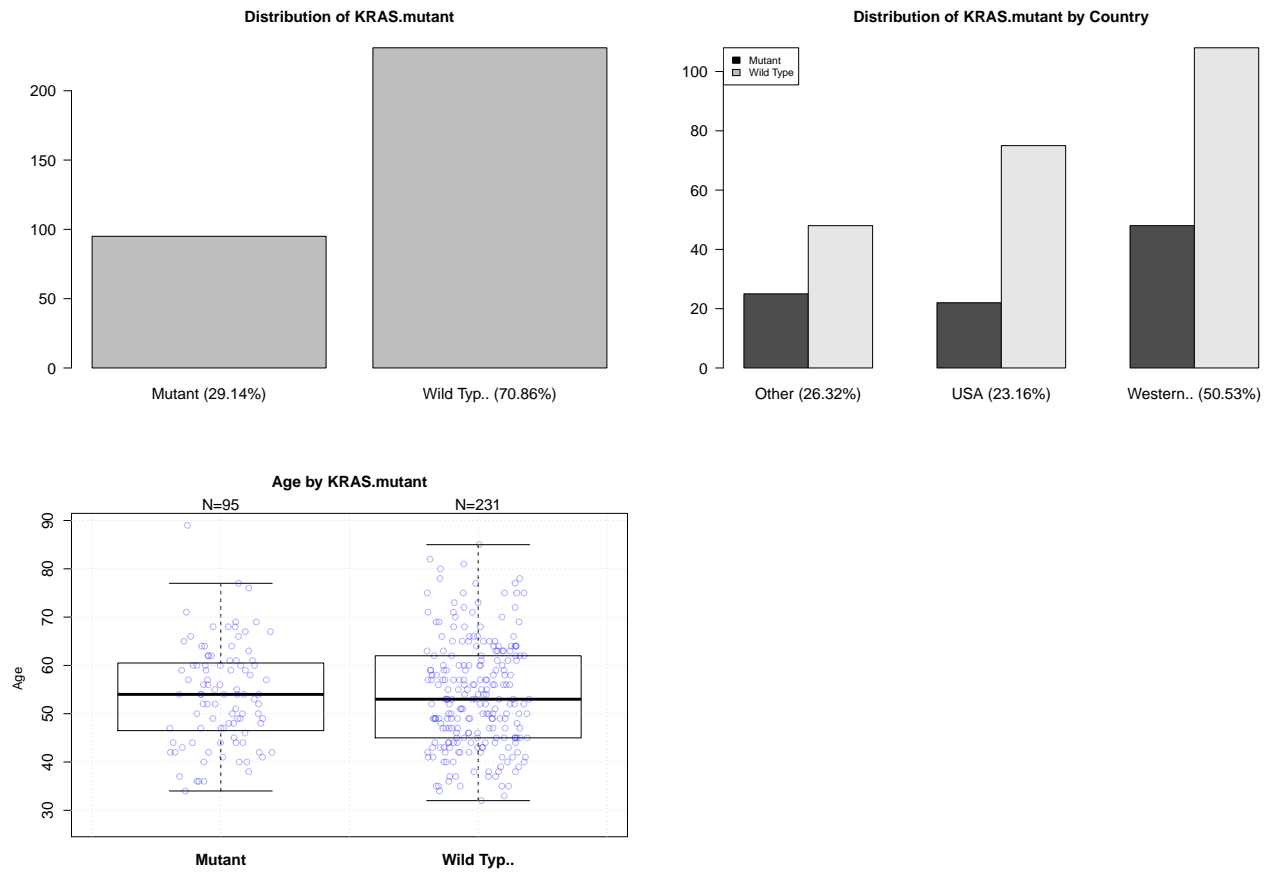

4.9 Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Don't plot association between variables but plot biomarker and clinical variables.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
             var=c("Country", "Age"), var.class=c("categorical", "numeric"),
             par.param = list(mfrow=c(2,2), cex.axis=1.2), show.association = FALSE,
             show.clinical.uni=TRUE)
```
Distribution of KRAS.mutant

Distribution of Country

Distribution of Age
N= 550

Mean: 53.53
SD: 10.56
Median: 53
Range: (27 – 89)

4.10 Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Plot only association between variables.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
            var=c("Country", "Age"), var.class=c("categorical", "numeric"),
            par.param = list(mfrow=c(1,2), cex.axis=1.2),
            show.biomarker.uni = FALSE)
```
Distribution of KRAS.mutant by Country

Age by KRAS.mutant

4.11 Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Plot only clinical variables.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
             var=c("Country", "Age"), var.class=c("categorical", "numeric"),
             par.param = list(mfrow=c(1,2), cex.axis=1.1),
             show.biomarker.uni = FALSE, show.association = FALSE,
             show.clinical.uni = TRUE)
```

Categorial biomarker variable. Categorical and numeric clinical variables. No log transformation. Plot only biomarker variable.

```
PlotProperty(data=input, biomarker.var="KRAS.mutant", biomarker.class="categorical",
             var=c("Country", "Age"), var.class=c("categorical", "numeric"),
             par.param = list(cex.axis=1.2),
             show.association = FALSE)
```
5 PlotRspBar(): Compare response outcome across different population

5.1 Plot response of one population

```
PlotRspBar (input, outcome.var="Response",
            rsp.levels=c("CR", "PR","SD","NON CR/PD", "PD","NE"))
```

```
## entries with missing outcome.var are removed! 524 entries left
```

Association of response rate
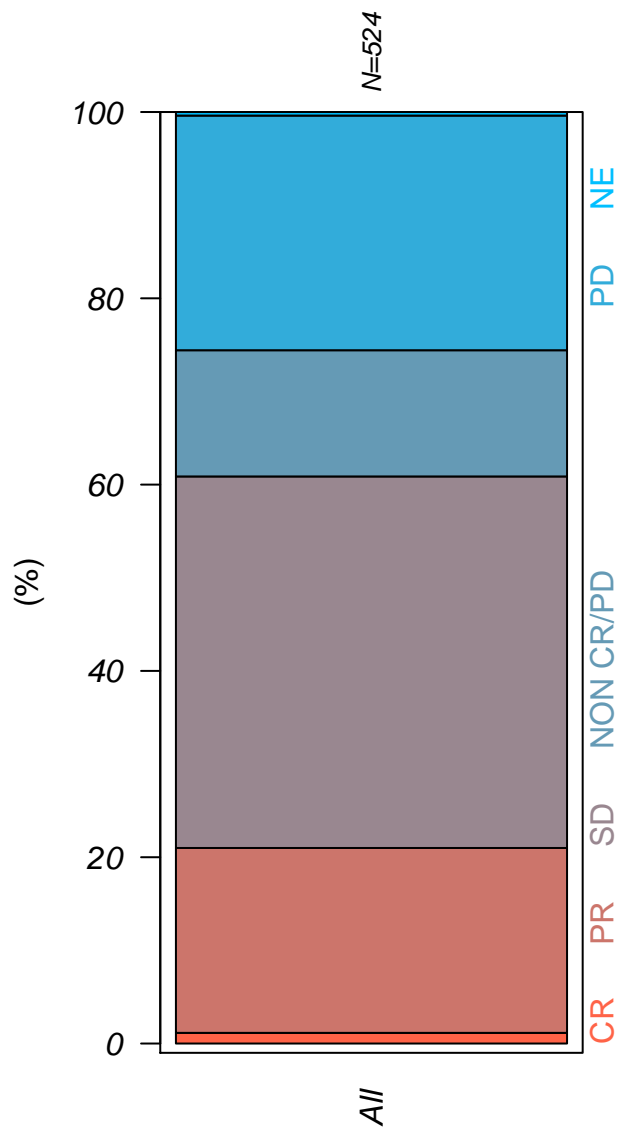

5.2 Plot response of one population, binarize outcome (classify classes to re- sponder vs non responder)

```
PlotRspBar (input, outcome.var="Response",
            binary=TRUE,
            rsp.response = c("CR","PR"),
            rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA))
```

```
## entries with missing outcome.var are removed! 524 entries left
```

5.3 Change color

```
PlotRspBar (input, outcome.var="Response",
            binary=TRUE,
```

```
          rsp.response = c("CR","PR"),
          rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA),
          col=c("green","orange"))
```

```
## entries with missing outcome.var are removed! 524 entries left
```

5.4   Plot horizontally

```
PlotRspBar (input, outcome.var="Response",
          binary=TRUE,
          rsp.response = c("CR","PR"),
          rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA),
          horiz=TRUE)
```

```
## entries with missing outcome.var are removed! 524 entries left
```

Rsp

non-Rsp

All

N=524; Rsp=21%

0   20   40   60   80   100

(%)
5.5 By arm

```
PlotRspBar (input, outcome.var="Response",
            binary=FALSE,
            rsp.levels=c("CR", "PR","SD","NON CR/PD", "PD","NE"),
            trt="Arm")
```

```
## entries with missing outcome.var are removed! 524 entries left
```

Association of response rate

```
PlotRspBar (input, outcome.var="Response",
           binary=TRUE,
           rsp.response = c("CR","PR"),
           rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA),
           trt="Arm")
```

entries with missing outcome.var are removed! 524 entries left

Association of response rate
5.6 Compare full population vs BEP

```
PlotRspBar (input, outcome.var="Response",
          binary=TRUE,
          rsp.response = c("CR","PR"),
          rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA),
          trt="Arm", compare.bep=TRUE,bep="BEP")
```

```
## entries with missing outcome.var are removed! 524 entries left
```

Association of response rate
5.7 Compare subgroups

```
PlotRspBar (input, outcome.var="Response",
           binary=TRUE,
           rsp.response = c("CR","PR"),
           rsp.nonresponse = c("SD", "PD","NON CR/PD","NE",NA),
           trt="Arm", compare.var=TRUE,var="KRAS.mutant")
```

```
## entries with missing outcome.var are removed! 524 entries left
```

Association of response rate
5.8 Plot count instead of percentage

```
PlotRspBar (input, outcome.var="Response",
           binary=FALSE,
           rsp.levels=c("CR", "PR","SD","NON CR/PD", "PD","NE"),
           trt="Arm",
           compare.var=TRUE,var="Sex", plot.count = TRUE)
```

entries with missing outcome.var are removed! 524 entries left

Association of response rate
6 PlotKM(): Plot KM curves for subpopulations

6.1 Without subgroup

```
print(PlotKM(data=sample.data, tte="PFS",cen="PFS.event",
          main="PFS ITT"))
```

PFS ITT

550	417	274	128	71	30	10	0

10 CoxTab(): fit cox proportional model for multiple covariates (additive model or separate models)

10.1 single covariate

```
CoxTab(data=sample.data, tte="OS", cens="OS.event",bep='BEP', var='Sex' )
```

```
##             HR    CI.low CI.high p-value n.trt n.ref
## Sex (M/F) "0.85" "0.42" "1.72"  "0.65"  "128" "129"
```

10.2 multiple covariates, ITT

Additive model will be fitted.

```
kable(
CoxTab(data=sample.data,tte="OS", cens="OS.event",  var=c('Sex',"Country","Age"),
       var.class=c("categorical","categorical","numeric"))
)
```

	HR	CI.low	CI.high	p-value	n.trt	n.ref
Sex (M/F)	0.72	0.48	1.08	0.11	277	273
Country (USA/Other)	0.65	0.36	1.2	0.17	127	198
Country (Western Europe/Other)	0.77	0.5	1.2	0.24	225	198
Age	1.01	0.99	1.03	0.43		

Simplify: automatically learn var.class from column class:

```
kable(
CoxTab(data=sample.data,tte="OS", cens="OS.event",  var=c('Sex',"Country","Age"))
)
```

	HR	CI.low	CI.high	p-value	n.trt	n.ref
Sex (M/F)	0.72	0.48	1.08	0.11	277	273
Country (USA/Other)	0.65	0.36	1.2	0.17	127	198
Country (Western Europe/Other)	0.77	0.5	1.2	0.24	225	198
Age	1.01	0.99	1.03	0.43		

10.3 BEP

```
kable(
CoxTab(data=sample.data,tte="OS", cens="OS.event",  var=c('Sex',"Country","Age"),
      var.class=c("categorical","categorical","numeric"), bep="BEP")
)
```

	HR	CI.low	CI.high	p-value	n.trt	n.ref
Sex (M/F)	0.85	0.42	1.73	0.65	128	129
Country (USA/Other)	1.17	0.4	3.38	0.77	76	57
Country (Western Europe/Other)	1.11	0.44	2.83	0.83	124	57
Age	1.01	0.98	1.04	0.48		

10.4   Reorder Sex: M as reference

```
kable(
CoxTab(data=sample.data,tte="OS", cens="OS.event",  var=c('Sex',"Country","Age"),
      var.class=c("ordered.factor","categorical","numeric"),
      ordered.factor.levels.list=list(Sex=c("M","F")),bep="BEP")
)
```

	HR	CI.low	CI.high	p-value	n.trt	n.ref
Sex (F/M)	1.12	0.68	1.85	0.65	129	128
Country (USA/Other)	1.17	0.4	3.38	0.77	76	57
Country (Western Europe/Other)	1.11	0.44	2.83	0.83	124	57
Age	1.01	0.98	1.04	0.48		

10.5   Fit separate models for each variable instead of fitting an additive model

```
kable(
CoxTab(data=sample.data,tte="OS", cens="OS.event",  var=c('Sex',"Country","Age"),
      additive=FALSE)
)
```

	HR	CI.low	CI.high	p-value	n.trt	n.ref
Sex (M/F)	0.71	0.48	1.07	0.099	277	273
Country (USA/Other)	0.67	0.37	1.22	0.19	127	198
Country (Western Europe/Other)	0.77	0.5	1.2	0.25	225	198
Age	1.01	0.99	1.02	0.54		

11 StatSummary()

11.1 Contunuous outcome

11.1.1 Create summary statistics

```
StatSummary(outcome.var = input$OS, treatment.var = input$Arm,
            placebo.code = "CTRL", active.code = "TRT",
            outcome.class = "continuous")
```

```
##  Effect.Size         Lower         Upper          P Mean.Placebo
##   0.79113129    0.19464513    1.38761744   0.00942898    5.77854999
##  Mean.Active
##   6.56968128
```

11.1.2 Add a covariate variable

```
StatSummary(outcome.var = input$OS, treatment.var = input$Arm,
            placebo.code = "CTRL", active.code = "TRT",
            outcome.class = "continuous", covariate.var = input$Sex)
```

```
##  Effect.Size         Lower         Upper          P Mean.Placebo
##  0.795751256   0.199865806   1.391636707   0.008954882   5.563721382
##  Mean.Active
##  6.359472638
```

11.1.3 Add return.fit = TRUE to return a table of summary statistics

```
StatSummary(outcome.var = input$OS, treatment.var = input$Arm,
            placebo.code = "CTRL", active.code = "TRT",
            outcome.class = "continuous", covariate.var = input$Sex,
            return.fit = TRUE)
```

```
## [[1]]
##  Effect.Size         Lower         Upper          P Mean.Placebo
##  0.795751256   0.199865806   1.391636707   0.008954882   5.563721382
##  Mean.Active
##  6.359472638
##
## [[2]]
##
## Call:
## lm(formula = outcome.var[subgroup.var] ~ covariate.var[subgroup.var] +
##     treatment.var[subgroup.var])
##
## Coefficients:
##                 (Intercept)      covariate.var[subgroup.var]M
##                      5.5637                            0.4204
## treatment.var[subgroup.var]TRT
##                      0.7958
```

11.2 Binary outcome

11.2.1 Create summary statistics

```
StatSummary(outcome.var = input$OS.event, treatment.var = input$Arm,
            placebo.code = "CTRL", active.code = "TRT",
            outcome.class = "binary")
```

```
##  Effect.Size        Lower        Upper           P  Rsp.Placebo
##  -0.04846512  -0.12251455   0.02558430   0.19901328   0.20879121
##   Rsp.Active     N.Placebo     N.Active  nRsp.Placebo  nRsp.Active
##   0.16032609  182.00000000  368.00000000  38.00000000  59.00000000
```

11.3 Survival variable

11.3.1 Create summary statistics

```
StatSummary(outcome.var = input[, c("OS", "OS.event")],
            treatment.var = input$Arm, placebo.code = "CTRL",
            active.code = "TRT", outcome.class = "survival")
```

```
## CTRL.events        CTRL.n      CTRL.MST    TRT.events         TRT.n      TRT.MST
##  38.0000000  182.0000000   14.8829569    59.0000000  368.0000000           NA
## Effect.Size        Lower        Upper           P
##   0.6667451    0.4432032    1.0030365    0.0517253
```

11.3.2 Add a covariate variable

```
StatSummary(outcome.var = input[, c("OS", "OS.event")],
            treatment.var = input$Arm, placebo.code = "CTRL",
            active.code = "TRT", outcome.class = "survival",
            covariate.var = input$Sex)
```

```
##  CTRL.events        CTRL.n      CTRL.MST    TRT.events         TRT.n
##  38.00000000  182.00000000   14.88295688   59.00000000  368.00000000
##      TRT.MST   Effect.Size         Lower        Upper           P
##           NA    0.63926120    0.42390908   0.96401541   0.03277593
```

11.3.3 Add a stratification variable

```
StatSummary(outcome.var = input[, c("OS", "OS.event")],
            treatment.var = input$Arm, placebo.code = "CTRL",
            active.code = "TRT", outcome.class = "survival",
            covariate.var = input$Sex, strat.factor.var = input$Age)
```

```
##  CTRL.events        CTRL.n      CTRL.MST    TRT.events         TRT.n
##  38.00000000  182.00000000   14.88295688   59.00000000  368.00000000
##      TRT.MST   Effect.Size         Lower        Upper           P
##           NA    0.60116855    0.37830923   0.95531273   0.03128551
```

12 LogRankTab(): log rank test for subgroup analysis

```
kable(
  LogRankTab(data=input,tte="PFS",cens="PFS.event",var="Arm")
)
```

	CTRL N=182	TRT N=368

Hazard Ratio		0.54
95% CI		(0.43;0.67)

13 BoxPlot(): advanced box plot function

13.1 Generate example dataset

```
example <- data.frame( y=c(rnorm(30)+10, rnorm(4)+20, rnorm(15)+15, NA),
                       time=c(rep("t2", 30), rep("t4",4), rep("t1", 15), "t3"),
                       grp=sample(1:3, 50, TRUE), sex=sample(1:2, 50, TRUE))
head(example)
```

```
##            y time grp sex
## 1  9.453643   t2   3   2
## 2  9.176470   t2   3   1
## 3 10.103796   t2   2   2
## 4  8.487022   t2   2   1
## 5  9.599060   t2   3   1
## 6  9.589478   t2   3   1
```

```
str(example)
```

```
## 'data.frame':    50 obs. of  4 variables:
##  $ y   : num  9.45 9.18 10.1 8.49 9.6 ...
##  $ time: Factor w/ 4 levels "t1","t2","t3",..: 2 2 2 2 2 2 2 2 2 2 ...
##  $ grp : int  3 3 2 2 3 3 2 3 3 2 ...
##  $ sex : int  2 1 2 1 1 1 1 2 2 2 ...
```

13.2 Specify data as named list

```
BoxPlot(list(a=rnorm(50,,3), b=rnorm(25,1,4), c=rnorm(75,2,1)))
```
Box Plot

13.3 Same plot, now horizontally plotted

```
BoxPlot(list(a=rnorm(50,,3), b=rnorm(25,1,4), c=rnorm(75,2,1)), horizontal=TRUE,
        Xaxis=list(las=2, hadj=2), Xaxis2=list(las=2, hadj=-.25))
```
Box Plot

13.4 Specify data as numeric matrix

```
BoxPlot(matrix(rnorm(100), ncol=4, dimnames=list(NULL, LETTERS[1:4])) )
```
Box Plot

13.5 Specify data as numeric (unnamed) vectors

```
BoxPlot(rnorm(50,,3), rnorm(25,1,2), rnorm(75,2,1))
```

Box Plot

13.6 ... horizontally plotted (no axis-label rotation done here)

```
BoxPlot(rnorm(50,,3), rnorm(25,1,2), rnorm(75,2,1), horizontal=TRUE)
```

Box Plot
13.7 Plot values 'y' according to time 'time' (factor levels are automatically ordered as e.g. function sort does)

```
BoxPlot(example, y~time, sc.pch=16)
```

Box Plot
13.8 Now as box-percentile plot

```
BoxPlot(example, y~time, sc.pch=16, box.type="bp")
```

Box–Percentile Plot
13.9 With custom main title

```
BoxPlot(example, y~time, sc.pch=16, box.type="bp", Title=list(main="Custom Main Title"))
```

Custom Main Title
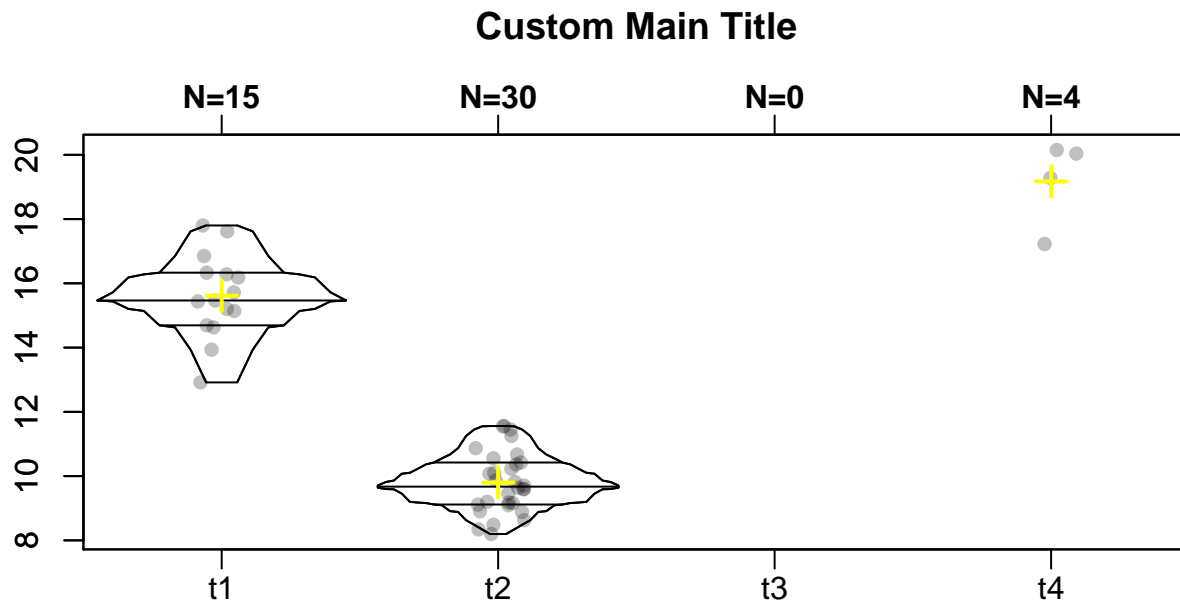

13.10 The same plot with trend line (connects either means or medians) and Y-axis label

```
BoxPlot(example, y~time, trend="median", ylab="Y-Axis Label")
```
Box Plot

13.11 Use an addition grouping variable to color points in the stripchart

```
BoxPlot(example, y~time, trend="median", ylab="Y-Axis Label",
        sc.col=c("red", "blue", "green")[example$grp] )
```

Box Plot

13.12 Use yet another grouping factor for plotting symbols in the stripchart

```
BoxPlot(example, y~time, trend="median", ylab="Y-Axis Label",
        sc.col=c("red", "blue", "green")[example$grp],
        sc.pch=c(5,10)[example$sex] )

legend("bottomright", fill=c("red", "green", "blue", "white", "white"),
```

```
            legend=c("Stage I", "Stage II", "Stage III", "Female", "Male"),
            pch=c(-1, -1, -1, 5, 10), border=NA)
```
Box Plot

13.13 Generate new dataset with different stucture

```
example2 <- data.frame(y1=12+rnorm(15), y2=15+rnorm(15), y3=25+rnorm(15))
```

13.14 Boxplot with trend lines (mean) and grid added to the plot

```
BoxPlot(example2, var=c("y1", "y2", "y3"), Grid=TRUE, trend="mean")
```
Box Plot

13.15 Now as box-percentile plot

```
BoxPlot(example2, var=c("y1", "y2", "y3"), box.type="bp", Grid=TRUE)
```

Box–Percentile Plot
13.16 Use yet another way to specify the data

```
BoxPlot(rnorm(1856, 5), runif(1245, 2,10), exp(rnorm(2311)), sc.col=as.rgb("black", .05),
        box.type="bp", Xaxis=list(labels=c("~N(5,1)", "~Unif(2,10)", "~exp(N(0,1))")), ylim=c(0,15))
```

Box–Percentile Plot
13.17 Specifying data as numeric matrix and using a trend-line connecting the means

```
mat <- matrix(c(rep(10,45), rep(15,45), rep(35,45))+rnorm(135), ncol=3)
BoxPlot(mat, trend="mean", trend.col="red", Ylabel=list(text="Example Measurements"))
```
Box Plot

13.18 Multiple grouping factors can be specified via the formula interface which is exemplified using the mtcars dataset, of interest is miles per gallon (mgp) depending on number of gears and on the number of cylinders

```
data(mtcars)
BoxPlot(mtcars, mpg~gear:cyl)
```
Box Plot

13.19 Now 'cyl' is explicitly nested within 'gear' which changes the ordering of combined grouping factors (which is identical to using formula 'mpg~cyl:gear').

```
BoxPlot(mtcars, mpg~cyl %in% gear)
```

13.20 More meaningful group-labels are best specified using custom factor-level names (increase width of the plot window)

```
dat <- mtcars
dat$cyl <- factor(dat$cyl, levels=c(4,6,8), labels=c("4Cyl", "6Cyl", "8Cyl"))
dat$gear <- factor(dat$gear, levels=c(3,4,5), labels=c("3Gear", "4Gear", "5Gear"))
BoxPlot(dat, mpg~cyl %in% gear)
```
13.21 One can use a table as Xaxis label representing the factor-level combination defining sub-classes

```
BoxPlot(dat, mpg~cyl:gear, XaxisTab=list(),mar=c(8,3,5,1))
```
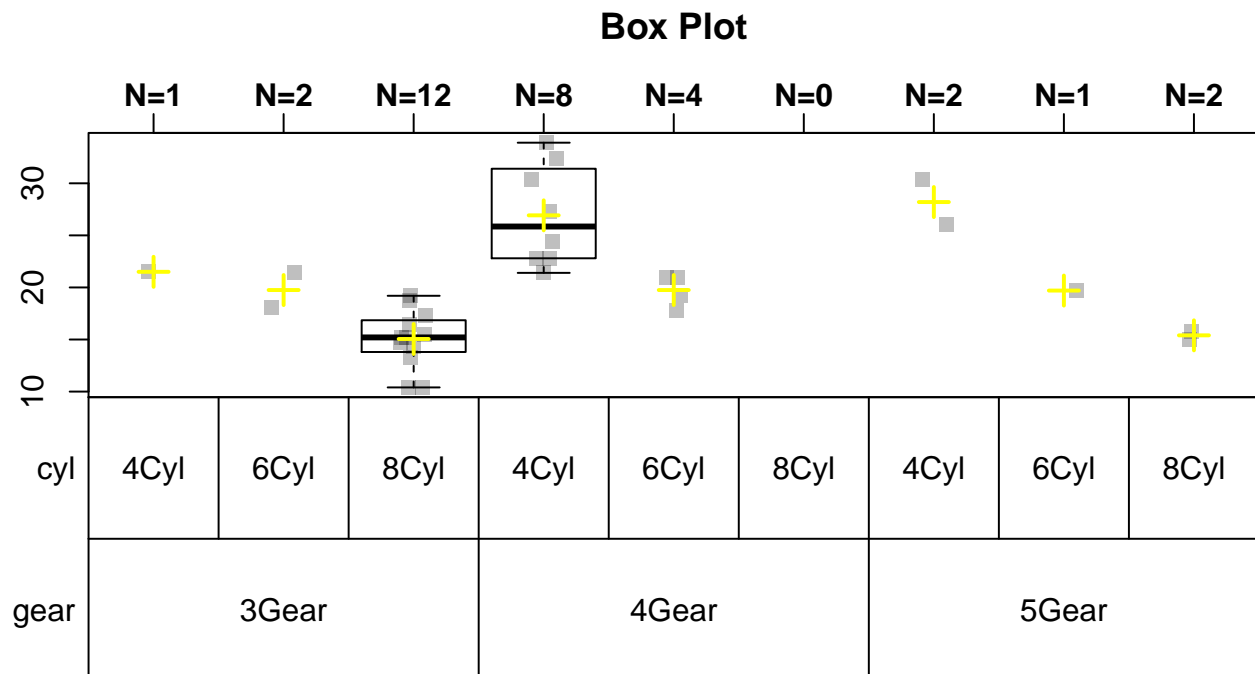

Box Plot

13.22 With the original factor levels and as horizontal plot

```
BoxPlot(mtcars, mpg~cyl:gear, XaxisTab=list(), mar=c(5,8,5,4),
        horizontal=TRUE, Ylabel=list(text="Y-axis label now appearing on X-axis"))
```
Box Plot

13.23 Using smaller bottom margin will result in smaller table height

```
BoxPlot(dat, mpg~cyl:gear, XaxisTab=list(font=2, col="darkblue", cex=1.25), mar=c(5,3,5,1))
```

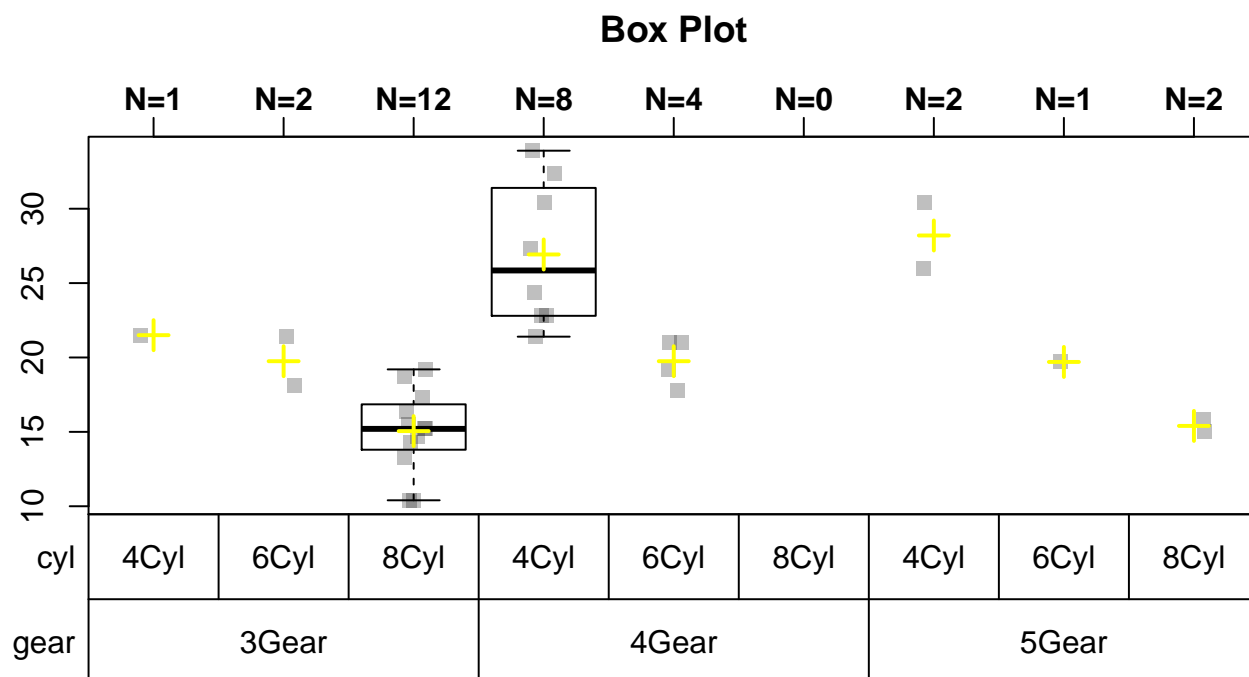

13.24 One can use different font-settings for rownames and cells of the table

```
BoxPlot(dat, mpg~cyl:gear, XaxisTab=list(Label=list(font=2, col="darkblue", cex=1.25),
          Text=list(col="red")), mar=c(5,3,5,1))
```
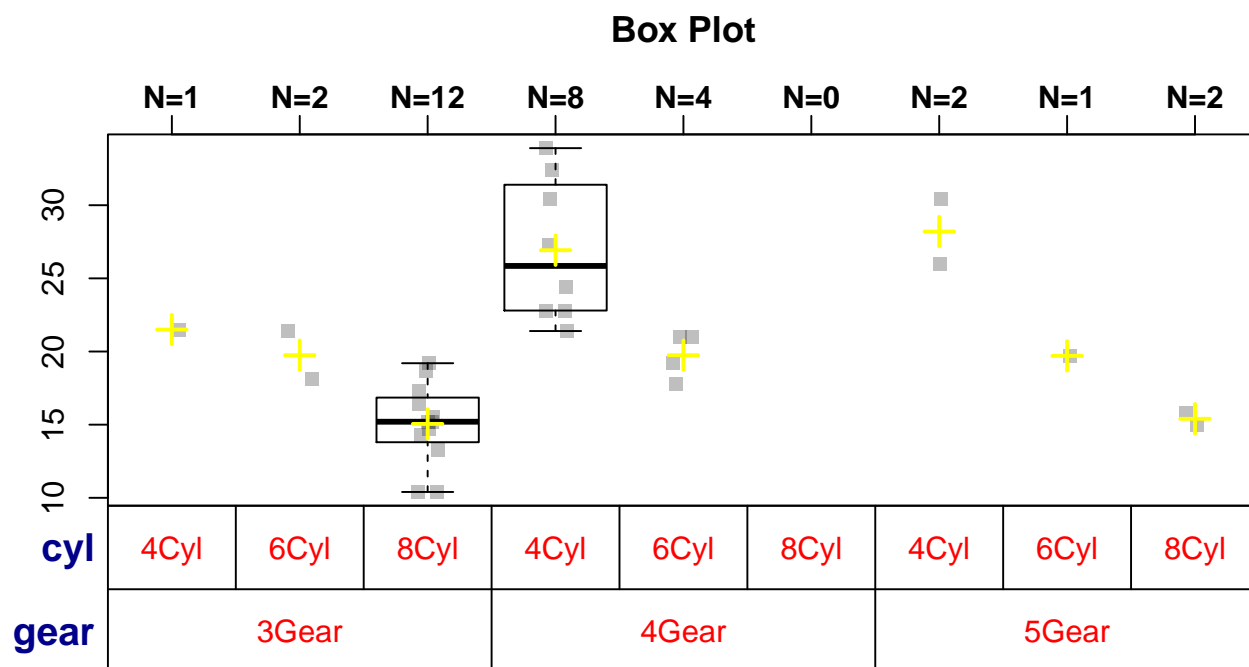

13.25   Use more crossed factors

```
BoxPlot(dat, mpg~cyl:gear:vs, XaxisTab=list(), mar=c(5,3,5,1))
```
Box Plot

13.26   Alternatively one can use the 'Xaxis' argument, but the ordering of these labels is not checked which is not important for automatically generated group-labels as shown in the previous example

```
BoxPlot(mtcars, mpg~cyl %in% gear,
          Xaxis=list(labels=paste(rep(c("4Cyl", "6Cyl", "8Cyl"),3),
                    c(rep("3Gear",3), rep("4Gear",3), rep("5Gear",3)), sep=".")))
```
13.27 The same plot with some fancy options

```
BoxPlot(dat, mpg~cyl %in% gear, Title=list(main="Miles per Gallon by Number of Gears",
        col.main="Green", cex.main=2.5), vline=c(3.5, 6.5), vl.lty=2, vl.col="gray", vl.lwd=2,
      Xaxis=list(labels=NA, at=1:9, tick=TRUE), col=c(rep("blue", 3), rep("red", 3), rep("green",
      Xaxis2=list(tick=FALSE), Yaxis=list(at=seq(10,34,2)), Grid=list(x=1:9, y=seq(10,34,2)),
      Xlabel=list(text=paste(rep(c("4Cyl", "6Cyl", "8Cyl"),3), c(rep("3Gear",3), rep("4Gear",3), r
                  at=1:9, las=2, adj=1, line=0.75, col=c(rep("blue", 3), rep("red", 3), rep("green
      mean.col=c(rep("cyan", 3), rep("orange", 3), rep("magenta", 3)), Box=FALSE, trend="mean",mar=
```
13.28 Horizontal fancy plot

```
BoxPlot(mtcars, mpg~cyl %in% gear, Title=list(main="Miles per Gallon by Number of Gears", col.main="#84d
        vline=c(3.5, 6.5), vl.lty=2, vl.col="gray", vl.lwd=2,
        Xaxis2=list(tick=FALSE, las=2, hadj=-.25), Yaxis=list(at=seq(10,34,2)), Grid=list(x=1:9, y=seq(1
        mean.col=c(rep("cyan", 3), rep("orange", 3), rep("magenta", 3)), Box=FALSE, trend="mean",
        mar=c(3, 7, 4, 4), horizontal=TRUE, sc.pch=c(0, 15)[dat$am+1], sc.col="wheat4",
        XaxisTab=list(Text=list(col=c(rep("cyan", 3), rep("orange", 3), rep("magenta", 3))))) )

 legend(x="topright", pch=c(0, 15), legend=c("automatic", "manual"), box.lty=0, col="wheat4")
```

14 Longitudinal analysis

In the context of biomarker analysis, the `PlotLong` function can be used to plot the longitudinal measurement
of a biomarker endpoint for one or more patient subpopulations. Here we'll use the packaged dataset `bmkr`
(biomarker) which has columns for patient ID (`pid`), treatment (`trt`), gender (`sex`), visitation month (`vm`)
and endpoint reading (`ep`)

14.1 Biomarker Endpoint Progression

14.1.1 Mean ± SEM Timecourse

Here we plot the mean and standard error of the mean over time. We can see clearly that the mean biomarker
endpoint increases throughout the study.

```
PlotLong(longbmkr, aes(x=vm, y=ep),
        xlab = 'Visitation Month',
        ylab = 'Biomarker Endpoint',
        labs.title = 'Mean ± SEM')
```
14.1.2 Tukey Hinges and Whiskers

However, we may be more interested in the population distrubtion progression where we'd want to plot the Tukey boxplot hinges and whiskers over time. From this plot, we can see that although there is a slow rise in population mean, the patient response also becomes more distributed.
```
PlotLong(longbmkr, aes(x=vm, y=ep), fun.data = 'tukey',
         xlab = 'Visitation Month',
         ylab = 'Biomarker Endpoint',
         labs.title = 'Tukey Whiskers and Hinges')
```

Tukey Whiskers and Hinges
14.2   Plotting Subpopulations

```
PlotLong(longbmkr, aes(x=vm, y=ep, group=trt, color=trt, fill=trt),
        fun.data = 'tukey', facet.fun = . ~ sex,
        xlab = 'Visitation Month',
        ylab = 'Biomarker Endpoint',
        labs.title = 'Biomarker Timecourse',
        labs.caption = 'Ribbons represent Tukey hinges and whiskers')
```

Biomarker Timecourse

14.3 Including sample counts

14.3.1 Sample counts as table above plot

```
library(dplyr)
```

```
## Warning: package 'dplyr' was built under R version 3.3.2

##     intersect, setdiff, setequal, union
```

```
PlotLong(longbmkr %>% filter(vm <= 24),
         aes(x=vm, y=ep, group=trt, color=trt, fill=trt),
         fun.data = 'tukey', facet.fun = . ~ sex,
         show.counts = 'table',
         xlab = 'Visitation Month',
         ylab = 'Biomarker Endpoint',
         labs.title = 'Biomarker Timecourse',
         labs.caption = 'Ribbons represent Tukey hinges and whiskers')
```

```
## Warning: package 'bindrcpp' was built under R version 3.3.2
```

Biomarker Timecourse

Ribbons represent Tukey hinges and whiskers
14.4   Plotting Deviations as Errorbars

```
PlotLong(longbmkr %>% filter(vm <= 24),
        aes(x=vm, y=ep, group=trt, color=trt, fill=trt),
        fun.data = 'tukey', facet.fun = . ~ sex,
        show.counts = 'table',
        plot.style = 'errorbars',
        xlab = 'Visitation Month',
        ylab = 'Biomarker Endpoint',
        labs.title = 'Biomarker Timecourse',
        labs.caption = 'Ribbons represent Tukey hinges and whiskers')
```
